

KNOW YOUR SUNSCREENS

Mineral filters are safe and do not harm the skin or seas. Many **chemical filters** have toxic effects on your skin and the environment, these are the three you should avoid:

INGREDIENTS MATTER!

One or more of these chemical filters is in 80% of broad spectrum sunscreens

These chemical filters are highly toxic and negative effects are exacerbated in sunlight. They are absorbed by the skin, causing hormone disruptions in humans and wildlife.

Oxybenzone and Octinoxate are proven to bleach and kill coral. They have been banned in Hawaii, setting the Gold Standard for ocean conservation. Many states follow.

1 drop of **oxybenzone** is enough to kill the coral in 6.5 olympic sized swimming pools.

More than **16,000 TONS** of sunscreen enters the waters around our reefs each year.

We need to know what is going on our skin and in our waters.
